

enVisionmath2.0

Poudre School District has adopted enVisionmath2.0 as our new math resource.

We are excited to implement it this year!

Below are some tips that will support your learning from home.

How to log-in at home:

1. Go to the Bethke Elementary homepage <https://bet.psdschools.org/>
2. Click on "Student Links"
3. Scroll to the bottom and click on "Envision Math"
4. Log-in using your psdschools.org email and password
5. Click on PearsonRealize or Dash

What does Pearson Realize offer?

There are three unique sections to Pearson Realize: Programs, Classes, and Grades

Click on "Programs" to find the following:

- Virtual Textbook—an exact replica of your student workbook
 - Click on the Topic of study and the precise lesson of the day
i.e. Topic 2; Lesson 2-1
 - This is a great way to review lessons when correcting homework or tests
- Lesson Videos—watch the explanation of the lesson focus (a great review if you are absent or confused on homework)

Click on "Classes" to find the following:

- Clear visual of assignments that are assigned, in progress, and completed
 - Click on the tab above to view assignments
 - Games and activities that are assigned will remain "In Progress" and will not move to the "Completed" section, allowing access to them throughout the year

- **ACTIVE-Book**—this is an exact replica of your student workbook that you can type on and print, or print and write on (a great resource if you are absent or lost your homework page)
- **Math Tools**—virtual math manipulatives to support problem solving
- **Game Center**—games that reinforce math skills (please challenge yourself—scroll down to check out grade 6 games!)
- **Math glossary**—when confused about language within a problem check out the glossary for the mathematical definition

Click on "**Grades**" to find the following:

- **Assignment Results**—you can view your progress and understanding of an assignment completed on the computer. Click on the bar above the assignment in the graph to view details.

What does Dash offer?

- Immediate access to the **ACTIVE-Book**—this is an exact replica of your student workbook that you can type on and print, or print and write on (a great resource if you are absent or lost your homework page)
 - Click on the Topic of study and the precise lesson of the day
i.e. Topic 2; Lesson 2-1

How can I use the BouncePages to help with homework?

1. Download the **FREE App: Pearson BouncePages**
2. **AIM** the camera so the **FULL** homework page is easily viewable on your screen
3. Tap the screen to scan the entire front of the homework page
4. Click on the **BouncePages** icon to view the corresponding video reminding you of the lesson's focus

- # Balanced Math Instruction

- 1/3 Procedural fluency
- 1/3 Conceptual understanding
- 1/3 Application

Mistakes are:

- Expected
- Respected
- Inspected

MESSAGE

17

Constructive Struggling

THE VALUE OF CHALLENGING OUR STUDENTS

American teachers are soft. That's the message I heard when I started my service in the Peace Corps. I was assigned to teach mathematics (in French) in Burkina Faso, a small West African country unknown to most Americans. Throughout our eleven weeks of training, our Burkinabè teacher trainers explained to us that American teachers tend to want all students to succeed and that we grade students too high. "Your students won't respect you if you are too soft," Sou and Salam reminded us on more than one occasion. Over time, I learned to put that message in perspective. I observed that the Burkinabè system was based on a philosophy that seemed to be aimed largely at eliminating students from the school system—a totally opposite goal from that in the United States, and a goal that carried its own challenges. But this experience caused me to take a closer look at what we expect of students in U.S. mathematics classrooms. I began to wonder whether our compassion for students and our desire for all students to succeed might in fact be disadvantaging them. It is now clear to me that in too many cases we are not expecting enough of our students. In fact, most mathematics teachers report to me that their students are not willing to try hard problems that they can't immediately see how to solve.

Over and over again, we hear that U.S. math students deal with less challenging mathematics than students in other countries. The content of international tests like TIMSS¹ and PISA², and the performance of U.S. students on those tests, reinforce the notion that our students may not be dealing with the same level of complexity in mathematics as students in other countries. I don't advocate that the United States should copy the programs of other countries; there are too many cultural and societal differences and too many challenges for any program to be successful on a large scale when it is transported in its entirety to a different setting. But I strongly support our close examination of practices used elsewhere that might inform

our work to improve mathematics teaching and learning in this country.

Spoon-Feeding Our Students

In *The Teaching Gap*, Jim Stigler and Jim Hiebert (1999) report the results of classroom observations that were part of the 1995 TIMSS. This particular part of the study sent observers to eighth-grade classrooms in the United States, Germany, and Japan. Observers categorized the level of mathematics evident in classrooms in these three countries. They noted that in U.S. classrooms, students typically dealt with a much lower level of mathematics content than students in other countries. Observers also noted that our students had far fewer opportunities to develop new mathematical learning; instead, they were simply being told what to do. Worse, observers reported that on the few occasions when American teachers chose mathematically complex tasks, their teaching approach tended to remove the complexity and reduce the difficulty of the tasks.

It appears that in the interest of having students succeed, we sometimes spoon-feed our students too much information and ask too little of them in return. We tell them what approach or tools they can use to solve a problem, or we guide them in a directed fashion that makes one path obvious, thus removing the challenge. In essence, we tell them how to solve a problem before they have a chance to tackle it themselves. Somewhere along the way, we seem to have decided that students shouldn't struggle with mathematics.

The Need for Complexity

One of the most important lessons we can learn from other countries is that sometimes mathematics is hard, and sometimes we have to struggle to figure things out,

¹Trends in International Mathematics and Science Study, formerly the Third International Mathematics and Science Study (<http://timss.bc.edu>)

²Programme for International Student Assessment, administered by the Organisation for Economic Co-operation and Development (OECD; www.pisa.oecd.org)

especially with problems that are complex. When we introduce complexity in the problems we ask students to solve and challenge them beyond what they think they can do, we give them the opportunity to struggle a bit—an opportunity that many students never experience in mathematics from elementary school through high school. A look at those American classrooms where teachers and students invite complexity shows that the kind of mathematics problems students can really sink their teeth into (and consequently might struggle with) are often more interesting and engaging than the problems we have traditionally provided in math classrooms. It turns out that offering students a chance to struggle may go hand in hand with motivating them, if we do it right.

Constructive Struggling

Some teachers and parents may be concerned that students will become frustrated or fall behind if they are given mathematics problems that seem too hard. I offer a new way to think about this by advocating *constructive struggling*, not pointless frustration. Constructive struggling can happen when a skillful teacher gives students engaging yet challenging problems. Constructive struggling can take place when a teacher decides that one demanding, possibly time-consuming problem will likely provide more learning value than several shorter but more obvious problems. Constructive struggling involves presenting students with problems that call for more than a superficial application of a rote procedure. Constructive struggling occurs when an effective teacher knows how to

provide guiding questions in a way that stops short of telling students everything they need to know to solve a problem. Constructive struggling can build from the elementary grades through the rest of a student's education as teachers continually balance the types of problems they give students. An effective teacher provides problems that range from straightforward applications of recently learned mathematics to more complex problems that require critical thinking and the connection of more than one mathematical concept, skill, or idea. As students engage in the constructive struggling needed for some of these problems, they learn that perseverance, in-depth analysis, and critical thinking are valued in mathematics as much as quick recall, direct skill application, and instant intuition.

What Can We Do?

Of course we want students to succeed, and we don't want students to dislike math class. Perhaps the way to help them most, both in terms of success and attitude, lies in the counterintuitive notion of finding the right level of struggle or challenge—a level that is both constructive and instructive. The business community tells us that the ability and willingness to tackle a problem that is not easily solved is one of the most important traits of a well-educated adult in the twenty-first century. If we do our job well and make students think just a little harder, we can prepare them to take on some of the most difficult problems we face today as well as the unknown problems we are likely to face tomorrow.

Reflection and Discussion

FOR TEACHERS

- What issues or challenges does this message raise for you? In what ways do you agree with or disagree with the main points of the message?
- What teaching actions or strategies do you think support or inhibit students' willingness to accept the struggle that goes with solving a challenging problem?
- How long do you allow your students to wrestle with a complex problem before you offer increasingly guided assistance? How frequently do you provide such an opportunity?
- How can you determine the right amount of frustration and struggle for any given student on any given task?
- How can you help your students develop the confidence and persistence necessary to persevere through a challenge?
